### **Xergi and GEO become partners on the Turkish market for large scale biogas installations**

Xergi has entered into a cooperation agreement with the Turkish engineering and contracting company, GEO, based in Izmir.

The agreement fits well into Xergi's internationalisation strategy of expanding its AD (anaerobic digestion) market by entering into licence agreements with local partners.

The aim of the cooperation is for GEO to develop and establish biogas plants on the Turkish market based on Xergi's advanced technology and extensive knowhow in the field of biogas.

Xergi CEO, Jørgen Ballermann, said: "We look very much forward to this new cooperation, and the opportunity to support GEO in becoming market leader on the Turkish market. By signing the agreement with GEO, we feel confident that we have found a reliable and very competent partner, who also has a thorough knowledge of the Turkish energy market."

Just like Xergi, GEO has many years experience in delivering turnkey energy plants, and the company is known as being an innovative, creative engineering and contracting company. For the past few years their strategy has been to focus on the renewable energy sector.

General Manager of GEO, Fatih Ertekin, said: "We are very excited by the creation of this new venture into the biogas market. We believe our entry is well timed as several projects are now in a late stage of development. By partnering with Xergi we are now able to offer the Turkish market world class technology. With the Danish technology and GEO's long experience as an energy plant contractor in Turkey we feel that we can really create value for our biogas customers."
